Overall flow:
1. Connects to a Xero demo company
2. Pulls Accounts and Vendors lists
3. Saves them to my local machine(any requirements on the output file type? JSON?CSV?)

User flow:
1. Server starts and connects to the Demo Company on Xero
2. User clicks the "Sync Accounts and Vendors" button
   ○ Server make API calls to fetch the lists
3. Users go to the specified path and should find the output file containing the Accounts and Vendors lists.

Creating new app on Xero:
● This is my first time using Xero. I found out that there are 3 integration types to choose from when adding a new app. There are :
   ○ Web app
   ○ Mobile or desktop app
   ○ Custom connection
And I'm exploring with the "Custom connection" option right now, just want to make sure I'm on the right track here, or would you suggest another approach for this task?

Deliverables(with PHP and React):
● Users can connect to the demo company on Xero
● Users can download the lists of Accounts and Vendors from Xero
● Users can open the download lists on their laptop
